

HFIG Enterprise Data Model — Data Vault 2.0 ERD

Accelerator v0.2.0 · hash rulebook 1.0.0 · 45 entities → 49 physical tables · 6 domains

Generated from metadata, not drawn. Every box comes from metadata/entities/*.yml, so the diagram cannot drift from the model — it can only be stale by one run `dfools/render_erd.py`. Satellites appear once per source, because that is what the factory actually creates.

- HUB

business key only · inserted once · never updated
- LINK / NHL

relationship · keys only, or immutable transaction payload
- SATELLITE

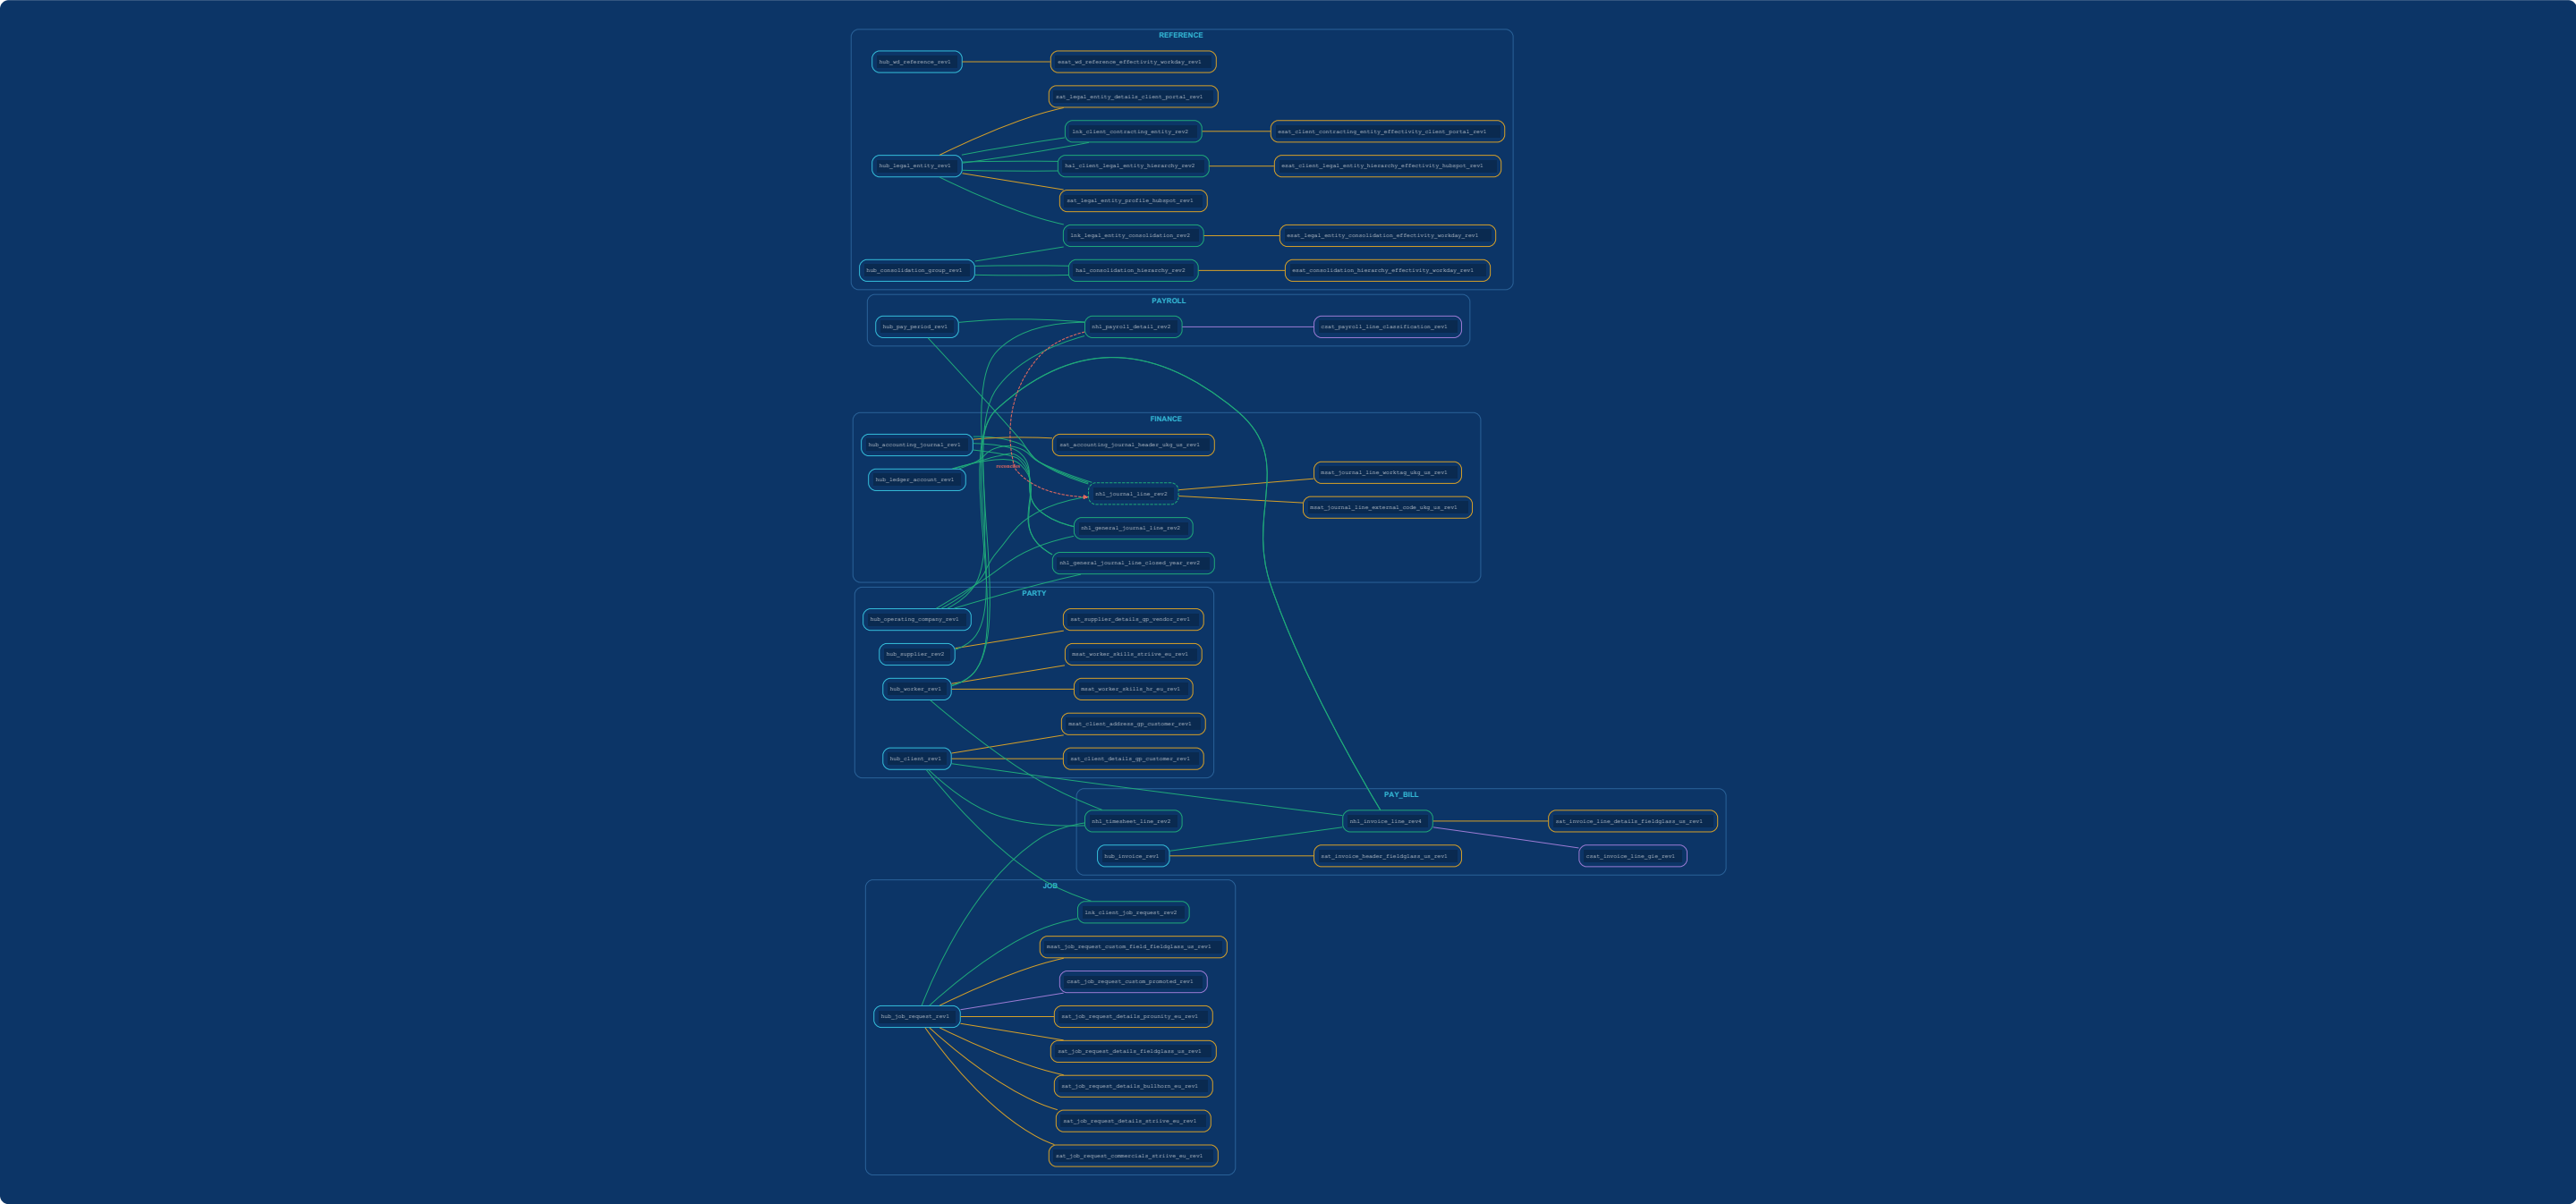

one table per source · insert-only · a change is a new row
- COMPUTED SAT

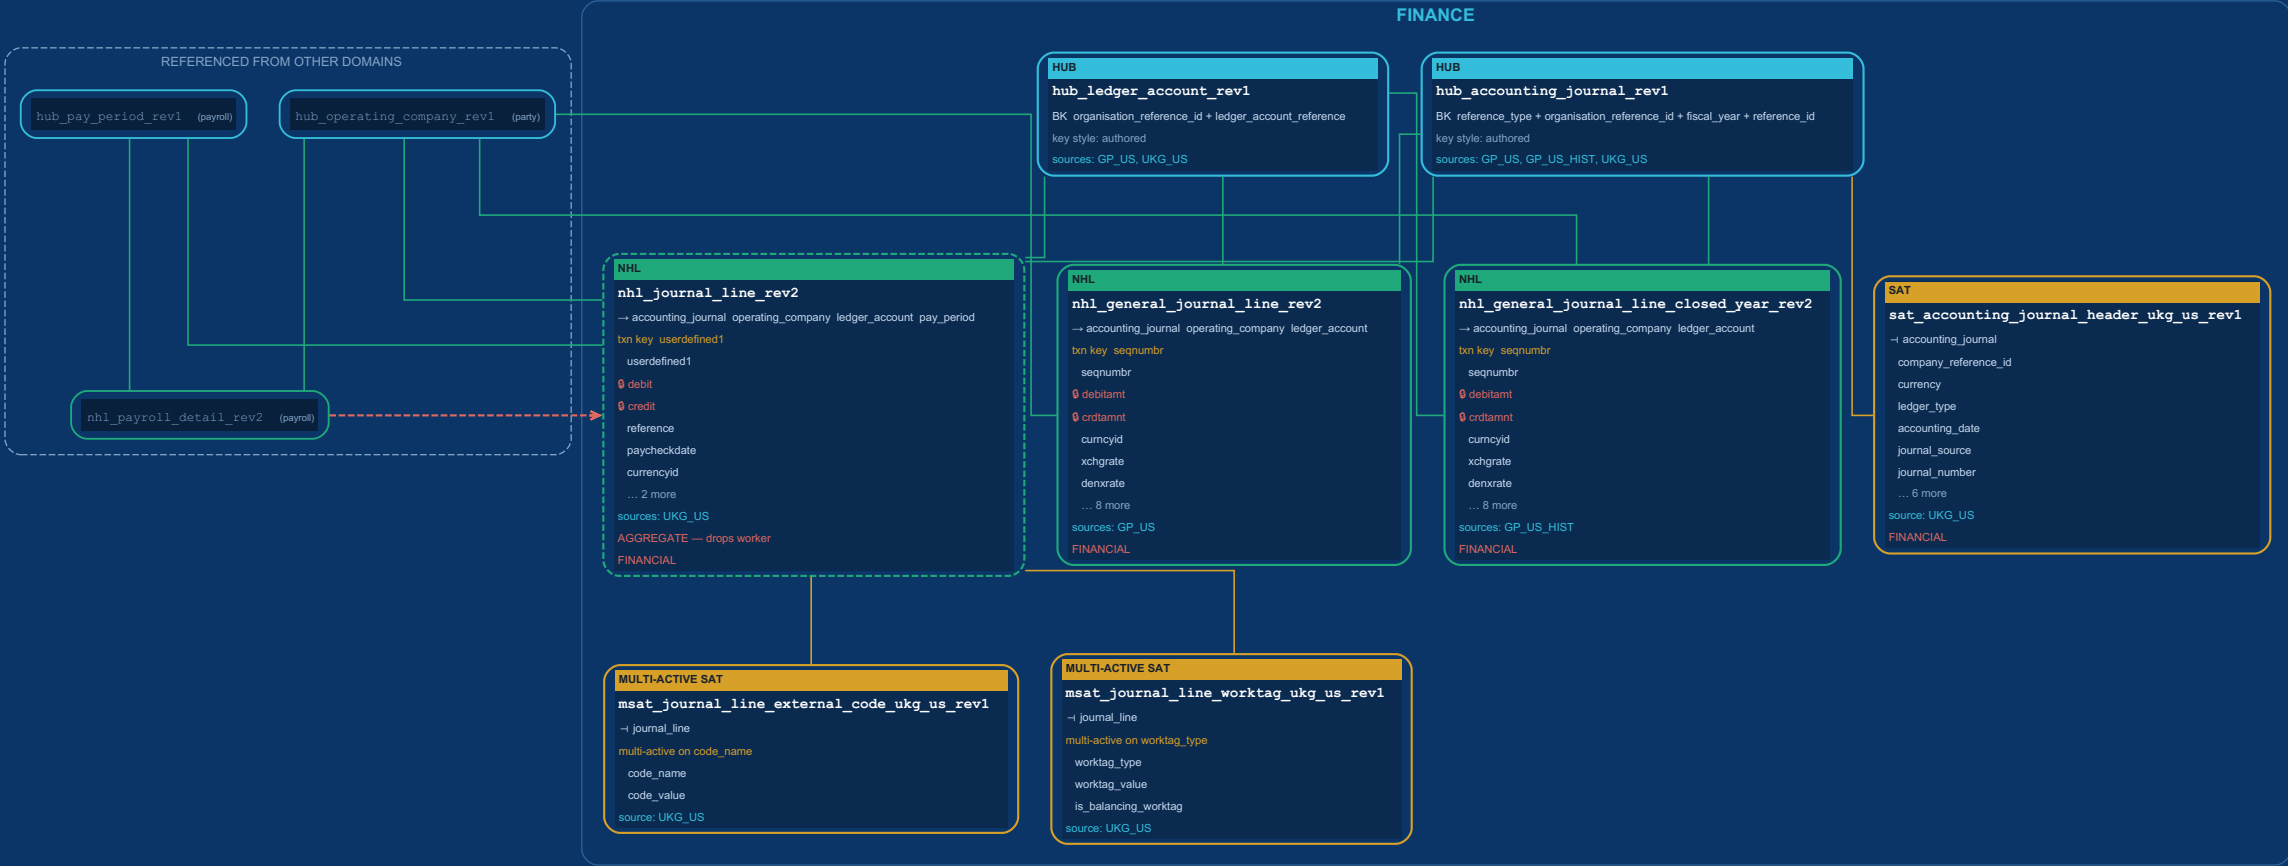

Business Vault · derived, rebuildable, rule-versioned
- dashed border

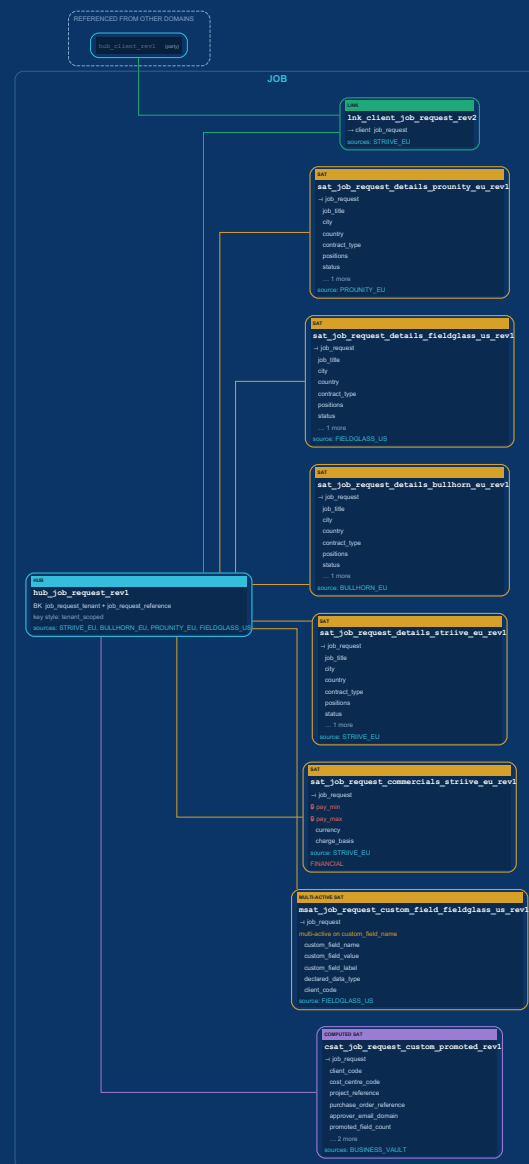

AGGREGATE grain — cannot answer a per-entity question
- Ø

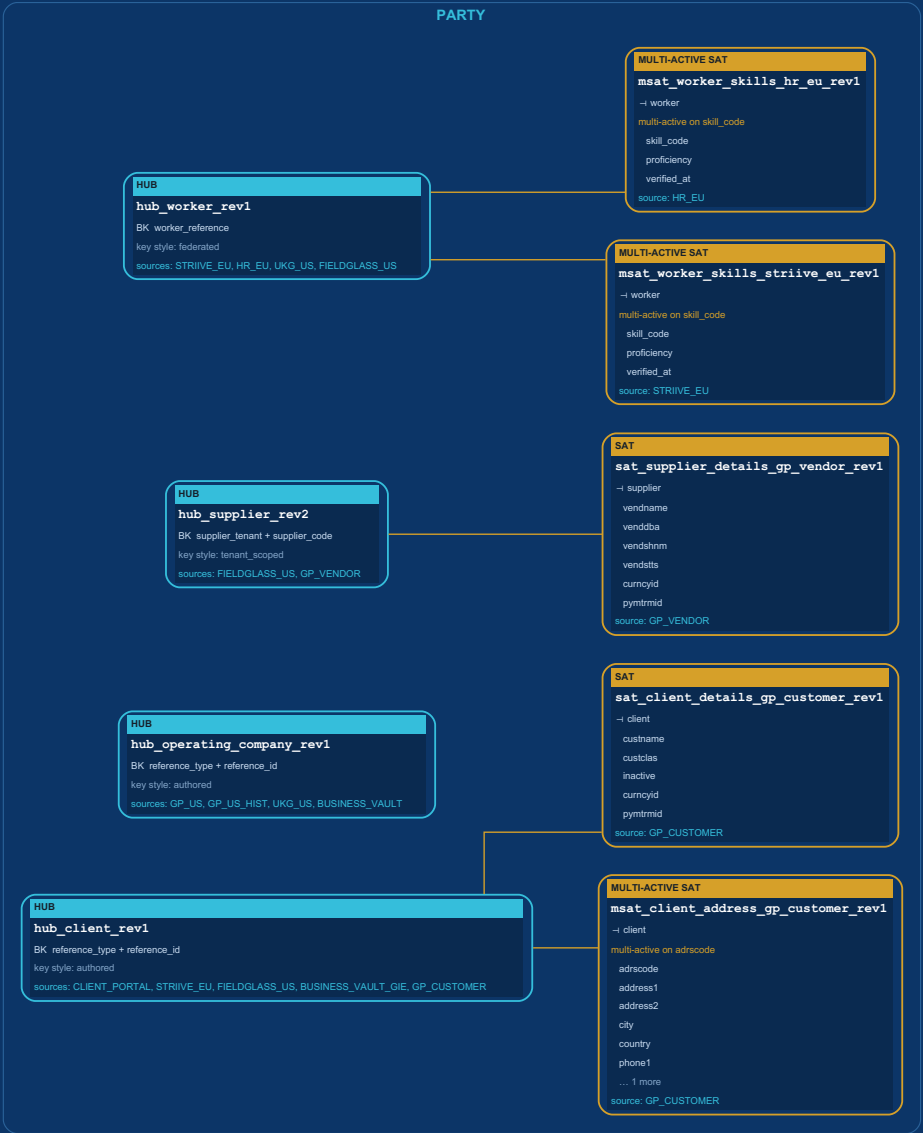

column mask declared in metadata, emitted into the table definition

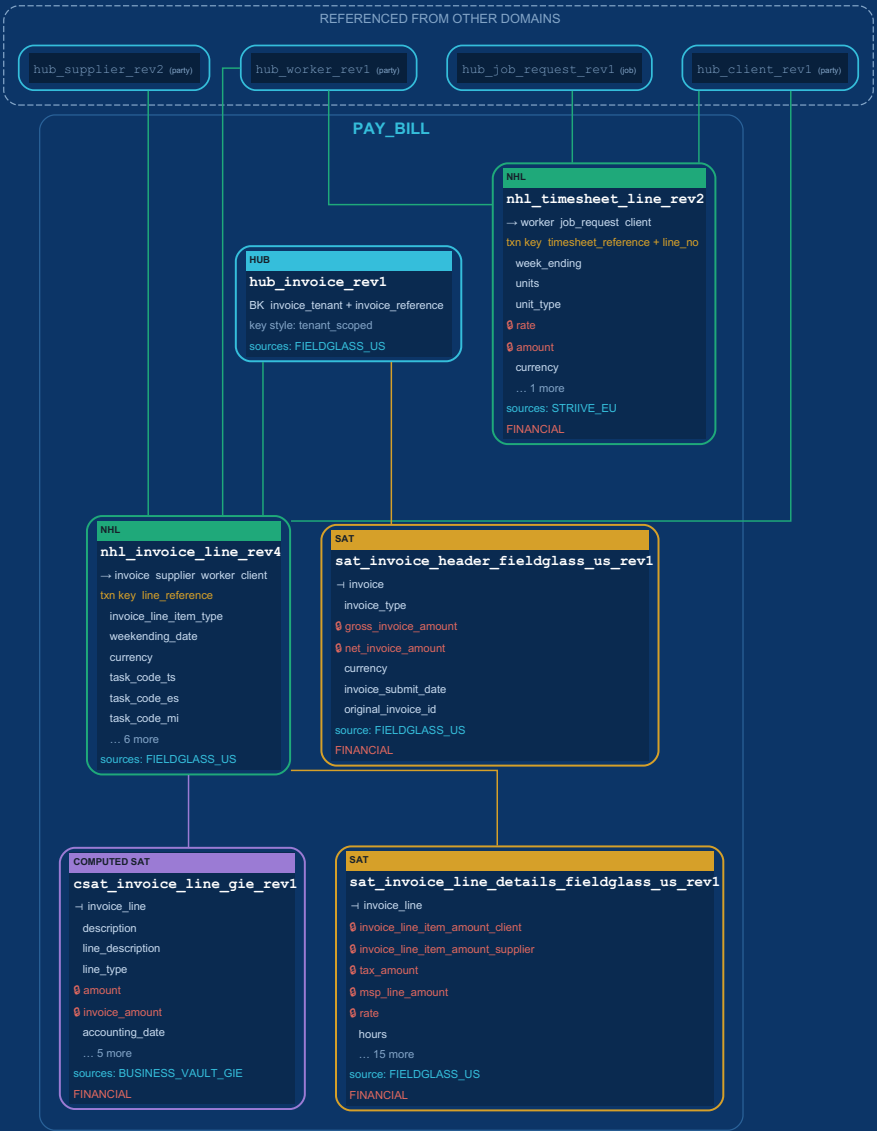

Overview — what exists and how it is wired

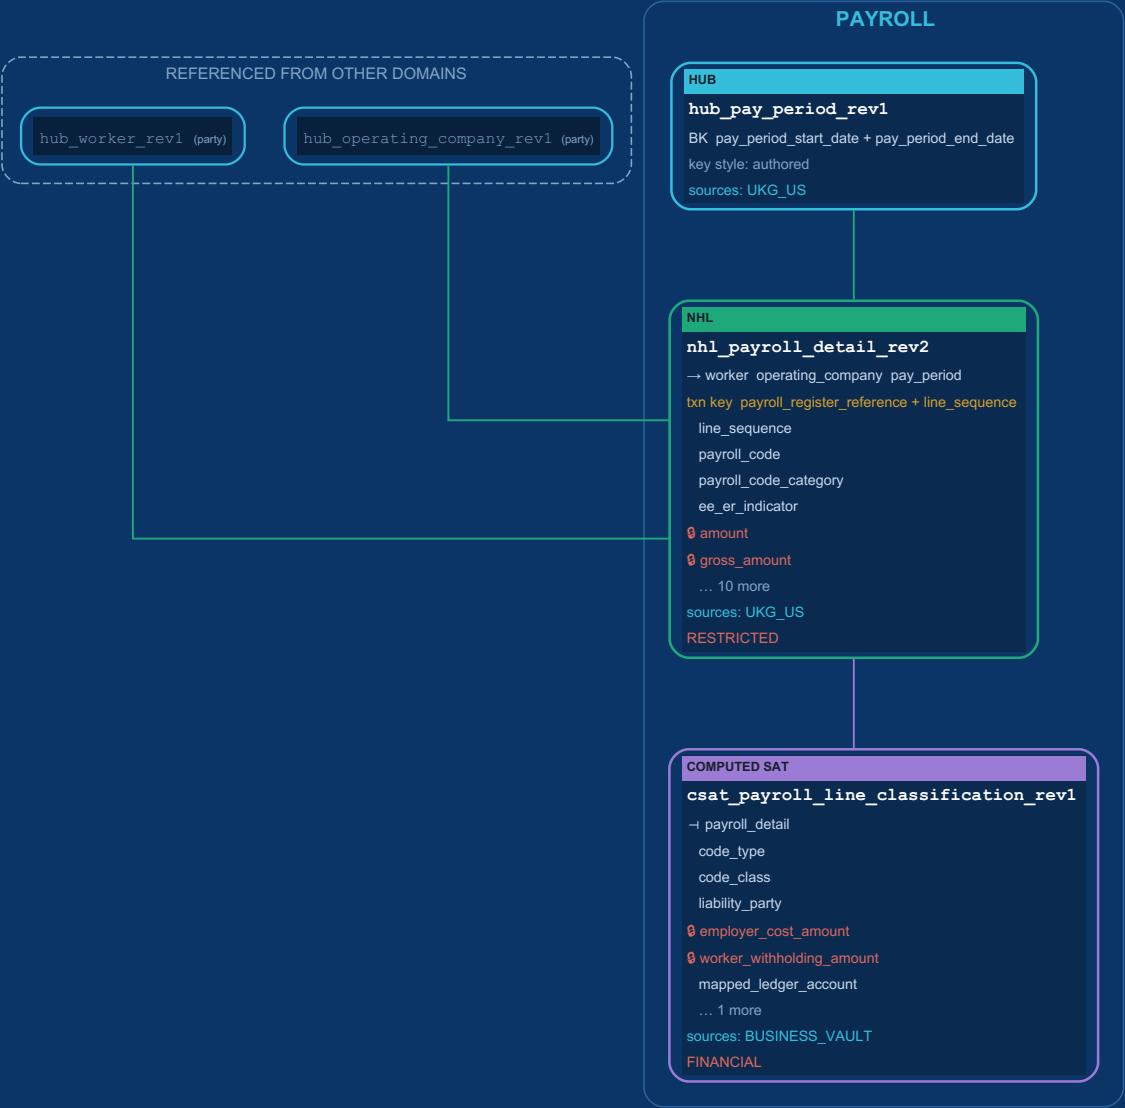

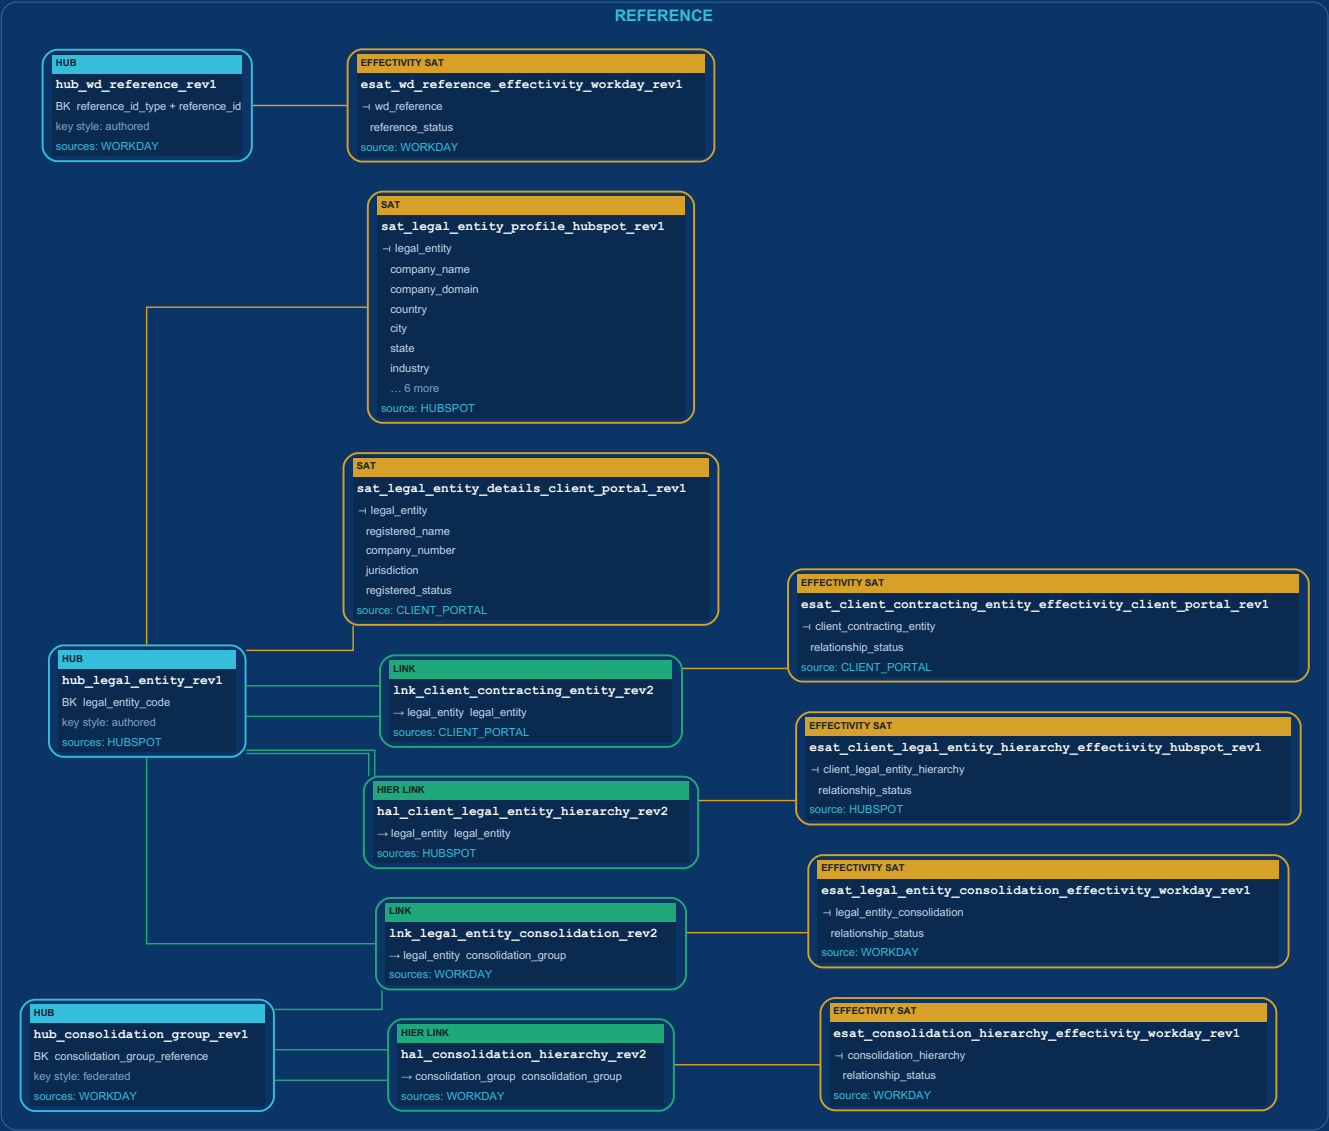

Grain pairs — what must not be confused

An aggregate is loaded faithfully and is correct in its own terms. The risk is silent: deriving a per-entity fact from a total. Each pair below is reconciled by `checks/aggregate_reconciliation_check.py`, which reads these declarations rather than hardcoded table names.

Aggregate	Transaction grain	Grain dropped	Raw parents
nhl_journal_line_rev2	nhl_payroll_detail_rev2	worker	worker, operating_company, pay_period

Masked columns

Masks are declared per column in metadata and emitted into each table's definition — for streaming tables and materialized views, `ALTER TABLE ... SET MASK` would not survive a pipeline update. The pipeline run-as identity must be privileged under every mask, or a refresh materialises NULLs into the vault.

Table	Column	Mask function	Sensitivity
csat_invoice_line_gie_rev1	amount	<code>governance.mask_money</code>	financial
